
**TECE DRAINLINE
SHOWER CHANNELS**

TECE 

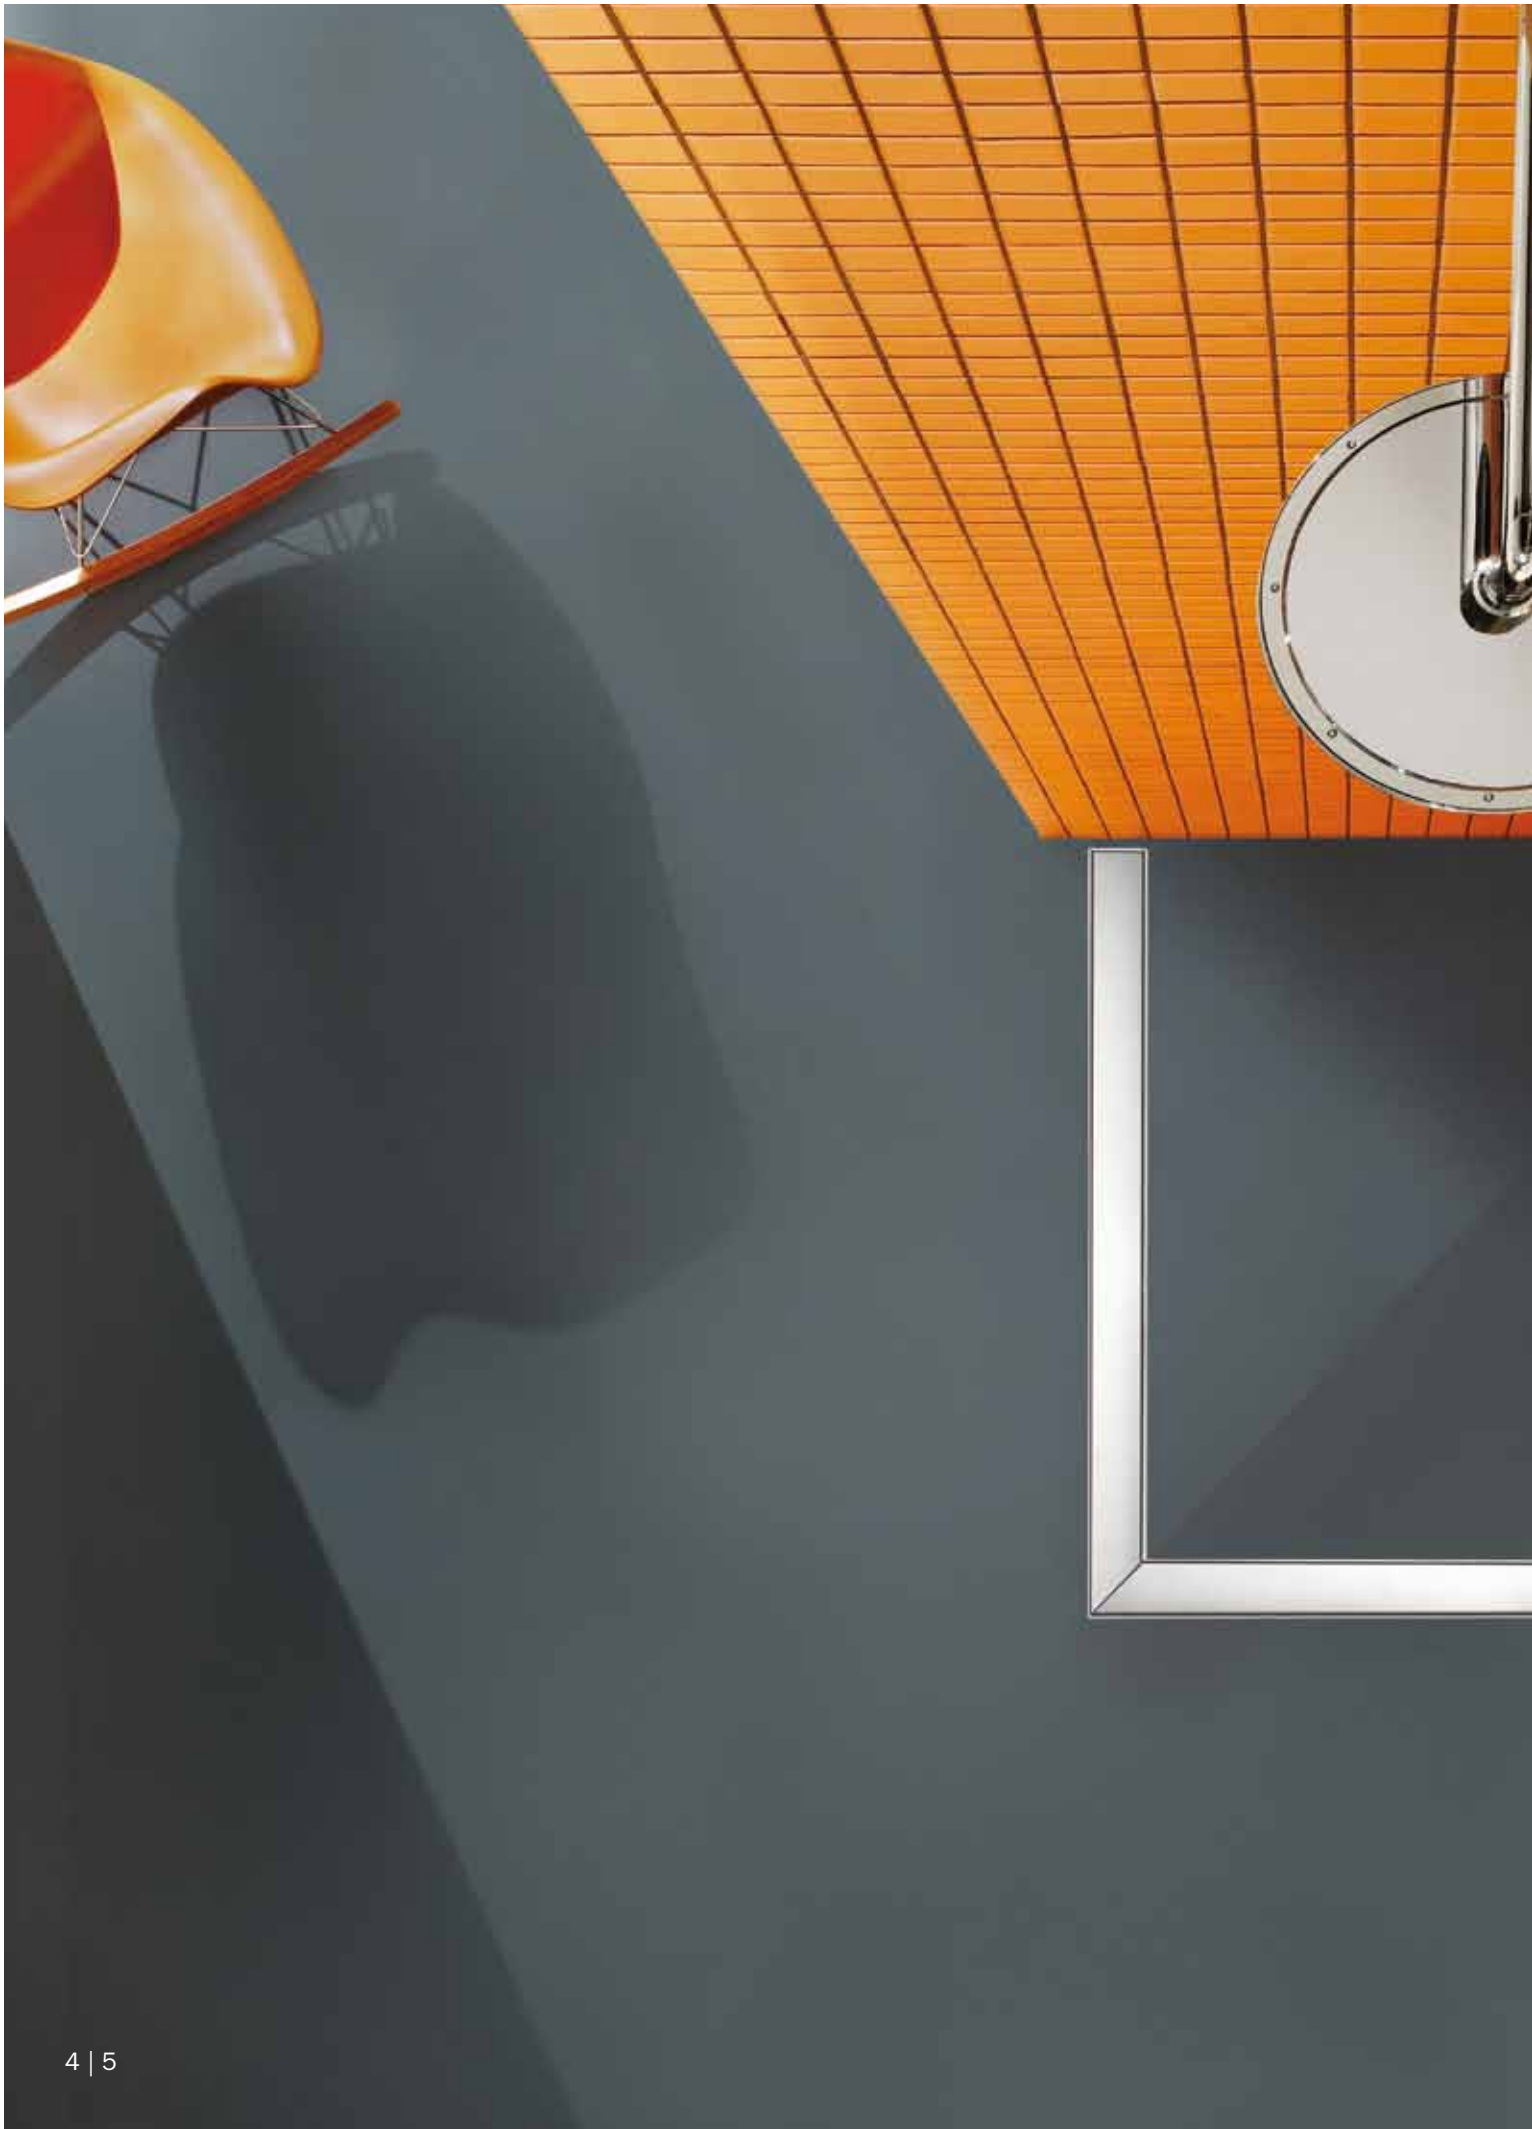

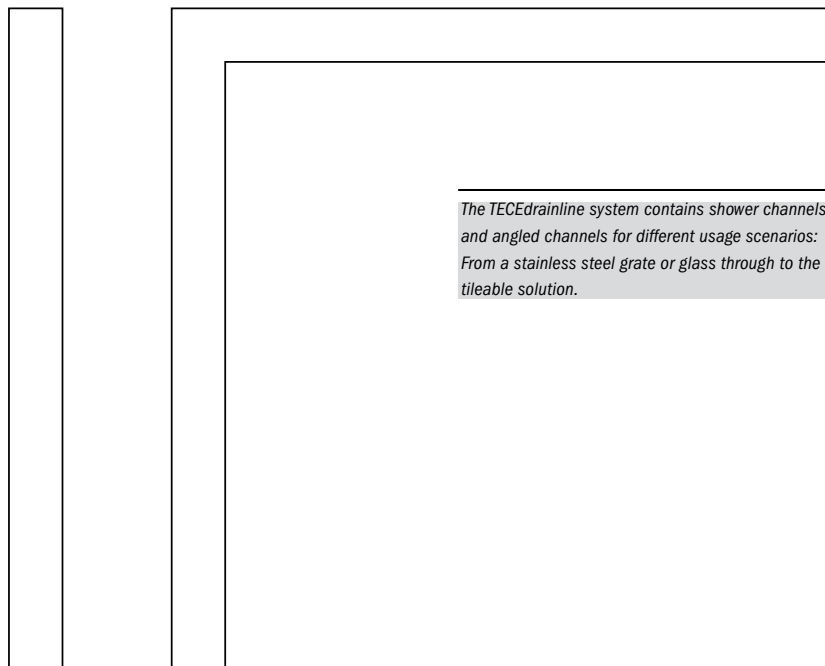

A minimalist bathroom shower area with a glass wall and a light-colored floor. The glass wall is on the left and right sides, and the floor is a light beige color. The shower area is a recessed platform with a white surface. The background is a light blue wall.

WATER – SIMPLY WASHED AWAY

TECEdrainline shower channels are reduced to the essentials: their function. They are the interfaces between the architecture and the building service applications – in stainless steel, glass or as a narrow gap in the floor that separates the shower area from the dry zones.

Shower channels are the epitome of a minimalist design that does not require a shower tub or cubicle. TECEdrainline shower channels eliminate the barriers in the bathroom and provide for a uniformly designed floor. This naturally enables the creation of barrier-free bathrooms with a generous character – real spaces for living.

The TECEdrainline system contains shower channels and angled channels for different usage scenarios: From a stainless steel grate or glass through to the tileable solution.

CREATING SPACE IN WHICH TO MOVE

Demands are increasingly being placed on the bathroom to function as a living space. TECEdrainline shower channels create floor-level drainage options – and therefore useable space. The technology is perfectly integrated in the floor – in both new and renovated buildings: The high-performance drainage technology, which meets all hygiene requirements, remains invisible.

NO MORE THAN A NARROW GAP

Stainless steel, glass or floor cover – genuine materials dictate the surface concept of the TECEdrainline shower channels. This approach is pursued most consistently with the „plate“ tileable shower channel insert, where the floor cover continues even on the channel. All that remains visible is a narrow gap around the area, which drains away the water. „Plate“ is ideal for tiled and natural stone floors.

THE STAINLESS STEEL PRINCIPLE

Stainless steel is a typical material in the bathroom: Authentic, permanent and conveying a sense of value. In addition to the „steel II“ variant – the inserted stainless steel slat – there are stainless steel grates in different designs. In addition, TECE produces architectural designs for custom-produced stainless steel grates.

THE TECHNOLOGY BELOW

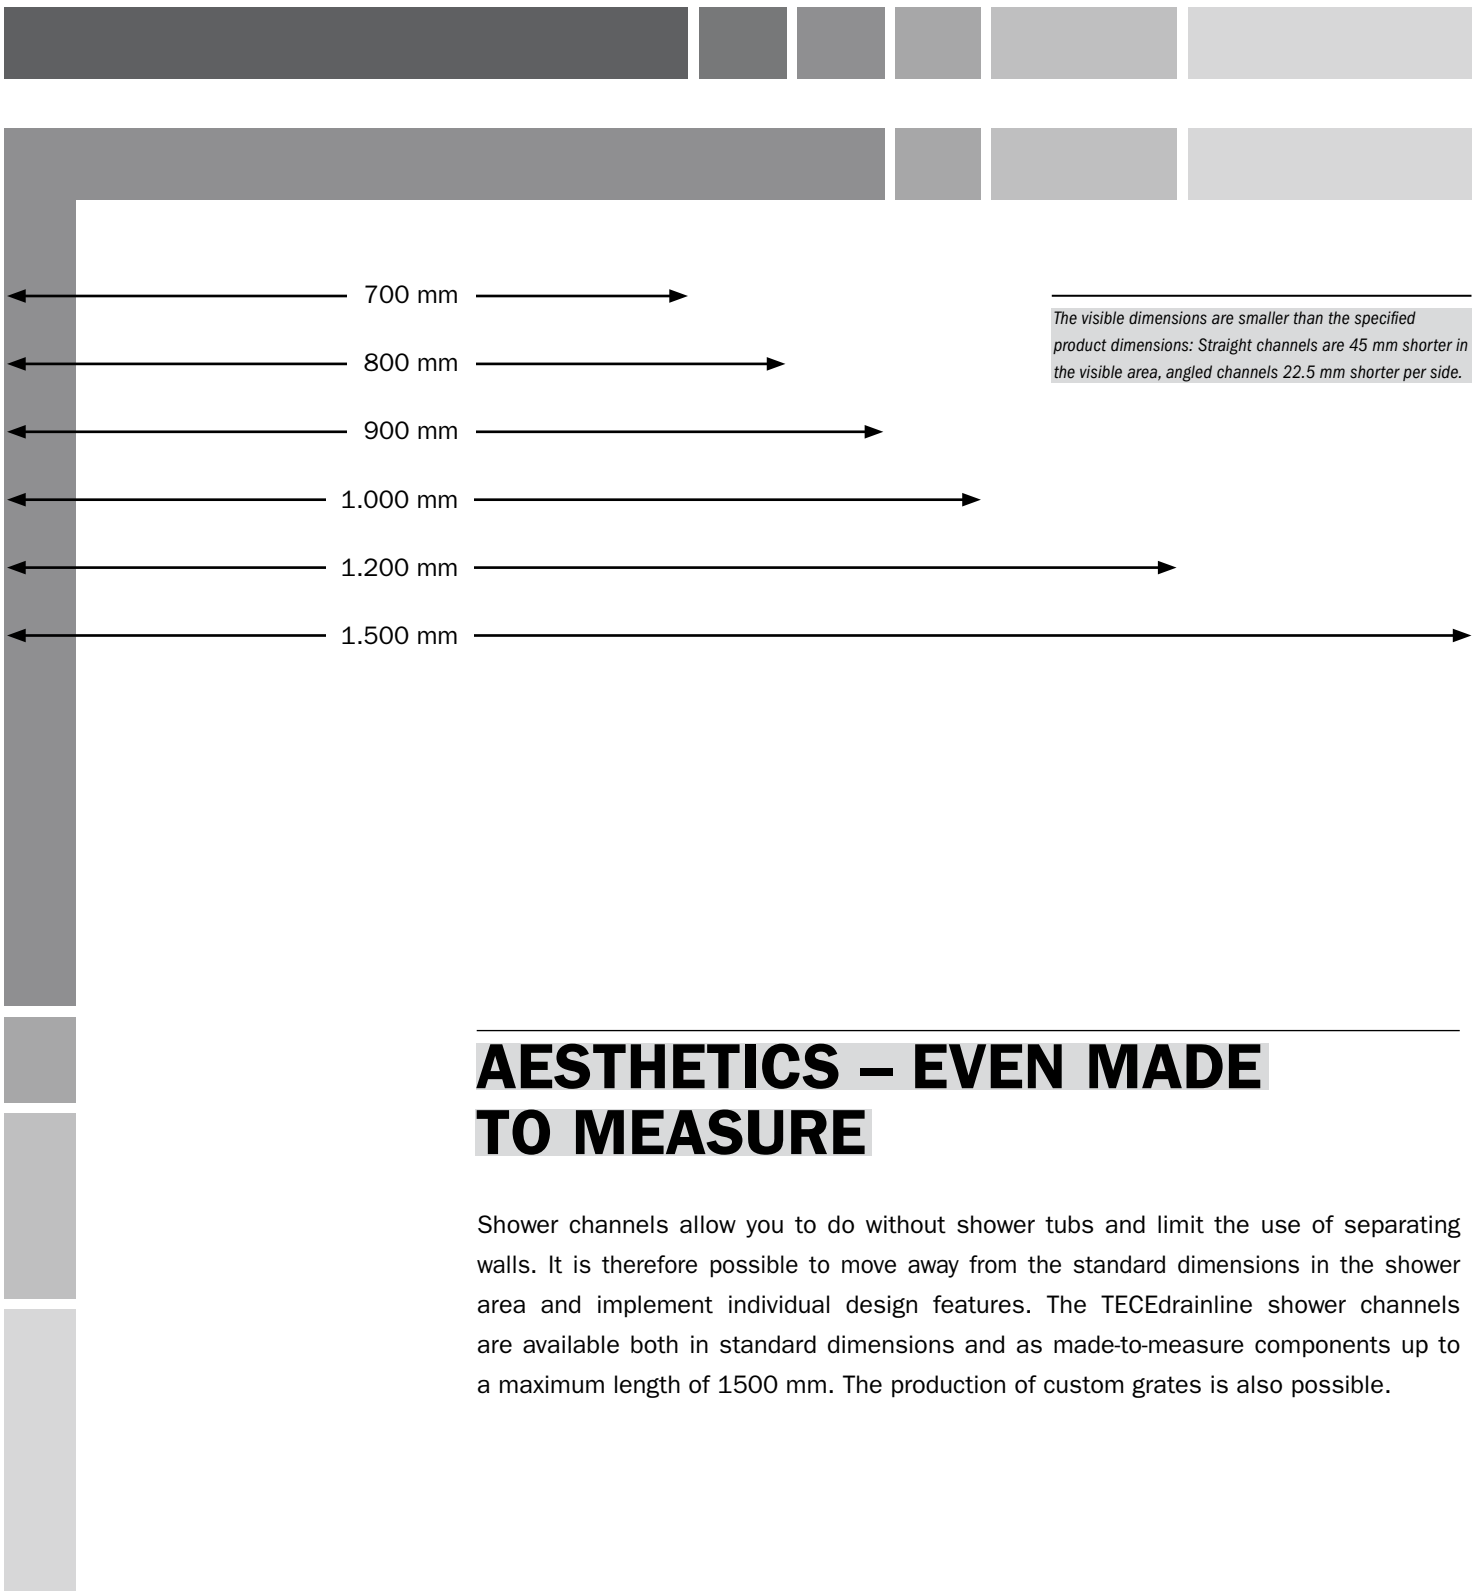

TECE has many years of experience in the construction of stainless steel channels: The hygienic, robust material is also used in the TECEdrainline shower channels: for the channel base and the cover, or in the shape of different grates. The design principle behind the shower channels is a streamlined look indicating high functionality.

Absolutely tight: A water-tight fleece ensures reliable sealing to the flooring.

Easy to clean: The channel inserts and grates can be removed using a simple tool and provide a clear view of hygienically smooth stainless steel surfaces.

The visible dimensions are smaller than the specified product dimensions: Straight channels are 45 mm shorter in the visible area, angled channels 22.5 mm shorter per side.

AESTHETICS – EVEN MADE TO MEASURE

Shower channels allow you to do without shower tubs and limit the use of separating walls. It is therefore possible to move away from the standard dimensions in the shower area and implement individual design features. The TECEdrainline shower channels are available both in standard dimensions and as made-to-measure components up to a maximum length of 1500 mm. The production of custom grates is also possible.

Channels for every installation situation: Horizontal drain with a particularly low assembly height of 95 mm with drainage capacity of 0.7 l/s. Maximum drainage capacity: 1.2 l/s with an assembly height of 148 mm. Vertical drain with 65 mm and 1.3 l/s.
